HOW TO STOP A HEART ATTACK BEFORE IT HAPPENS

Amazingly detailed new
HEART SCANS help doctors
spot trouble without
surgery. How technology
could save your life

Mike Fackelmann, 50,
holds a scan of his
heart, which revealed
a major blockage of a
coronary artery (arrow)

Ziekenhuis
Oost-Limburg

- Leading cause of worldwide morbidity & mortality
 - 1 of 5 deaths related to cardiac disease
 - More than 12 million US citizens have history of CAD
 - Each year 1.1 million US citizens have heart attack
 - >40% does not survive cardiac event
- Angiography of the coronary arteries
 - Reference standard for evaluation of the coronary arteries
 - Possibility for balloon dilatation & stenting
 - 40% does not detect significant coronary artery disease

- Avoid (nearly) negative coronary angiography
 - 'invasive' examination
 - higher threshold for patient and cardiologist
 - puncture- and procedure-related complications
- Exclude significant coronary artery disease
 - non-invasive, safe examination
 - low threshold for patient
 - high negative predictive value >> positive predictive value

- Anatomy
- Calcium score
- Angiography
- Evolution through the years
- Bunch of great looking pictures

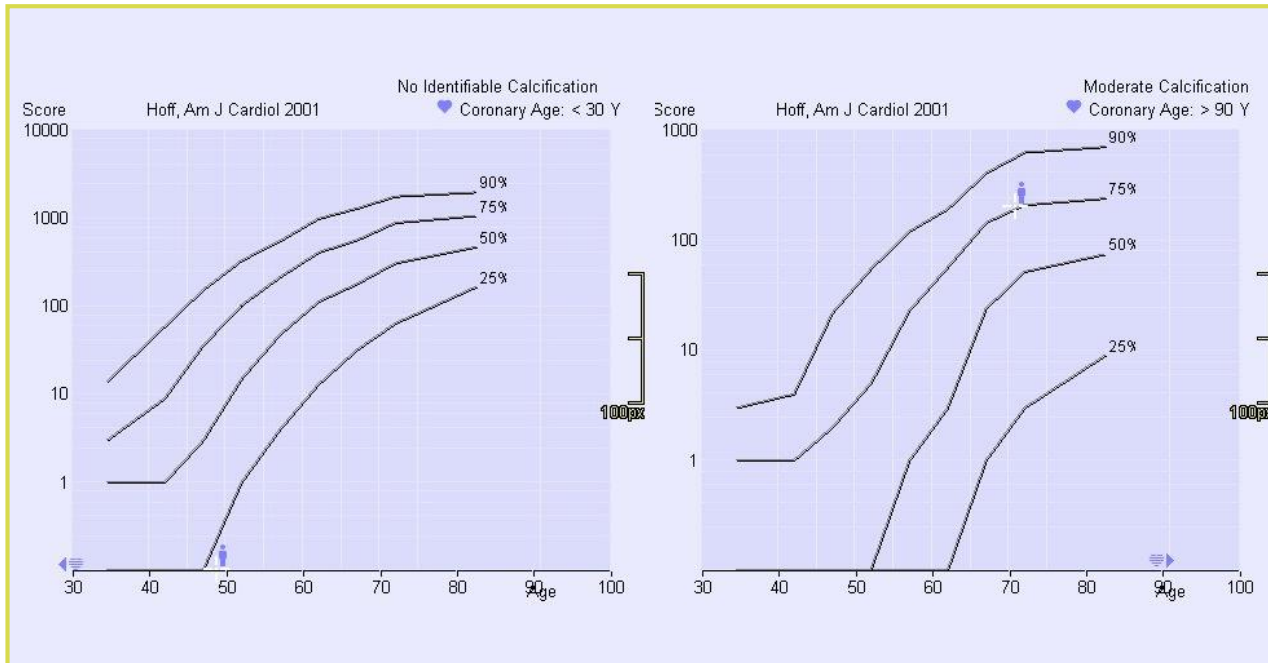

Calcium is a marker for a diseased artery

- Absolute score
- Percentile for that person's age, sex, and ethnicity

Anything above the 75th percentile for age, sex, and ethnicity or an absolute score of 300 (Agatston units) is abnormal

Calcium score

Artery	Lesions	Volume / mm ³	Equiv. Mass / mg	Score
LM	0	0,0	0,00	0,0
LAD	6	103,4	18,54	119,1
CX	1	8,5	1,26	6,1
RCA	6	75,0	13,08	74,0
Total	13	186,9	32,89	199,1
U1	0	0,0	0,00	0,0
U2	0	0,0	0,00	0,0

Settings

Score Type: Agatston equivalent, Threshold: 130 HU (95,6 mg/cm³ Ca)
Mass calibration factor: 0,7.

- The presence of coronary artery calcium (CAC) is highly sensitive for the presence of ≥ 50 percent angiographic stenosis.
- The absence of CAC, particularly in an asymptomatic patient, is highly predictive of the absence of significant coronary artery stenosis and implies a favorable prognosis.
- CAC screening, especially for intermediate risk patients, can enhance the prediction of risk in asymptomatic individuals and increase the predictive value of the Framingham Risk Score.

However

- Ca-score underestimates atherosclerosis
- non-calcified plaques ?
- Ca-score only useful when combined with other tests

CCTA is a noninvasive method to image the coronary arteries.

Applications include the following:

- Diagnosis of coronary artery disease (CAD) for symptomatic patients who are at **intermediate risk for CAD after initial risk stratification**, including patients with ECG uninterpretable for ischemic changes (baseline ST segment abnormalities, LBBB), patients who are unable to exercise, and patients with equivocal stress test results.
- Identifying suspected coronary artery anomalies
- Diagnosis of in-stent restenosis
- Evaluation of coronary bypass graft patency

Evolution through the years

10 mm detector
Pitch ~0.25

3 cm in 5 sec

20 mm detector
Pitch ~0.25

6.2 cm in 5 sec

40 mm detector
Pitch ~0.25

12.5 cm in 5 sec

Dual source CT force: Pitch=3.2, 12-16 cm **in 0.2 sec**

Evolution through the years

- Temporal resolution
- Spatial resolution
- Reconstruction techniques
- Artifact reduction
- Dose reduction
- Contrast agent reduction

Diagnostic modality	Typical effective radiation dose (mSv)	Equivalent number of chest X-rays	Approximate equivalent period of natural background radiation
Chest (single PA film)¹⁻⁹	0.02	1	3 days
Echocardiography²	0	0	0
Electron-beam CT^{4,5}	1.5–2	75–100	7–9 months
Multi-slice CT⁴⁻⁷			
Calcium score	1.5–2.7	75–135	7–14 months
CTCA (16 slices)	6.5–10.7	325–535	2.7–4.4 years
CTCA s/p CABG (16 slices)	12.9	645	5.3 years
CTCA (64 slices)	10.5	400	3 years
Magnetic resonance imaging¹⁻³	0	0	0
Catheterisation laboratory			
Diagnostic coronary study (Coronary angiography and ventriculography) ^{1,8,9,11}	2.1–7	105–350	0.9–2.9 years
Angiography s/p CABG ⁸	6.3	315	2.6 years
Aortography ⁸	4	200	1.6 years
Coronary angioplasty ^{1,3,8,9,11}	7.5–57	375–2,850	3–23 years
Carotid stenting ^{8,11}	10	500	4.1 years
Nuclear cardiology¹⁻³			
²⁰¹ Thallium-Cl (2 mCi)	17	850	7 years
^{99m} Tc tetrofosmin (30 mCi)	8.5	425	3.5 years
^{99m} Tc sestamibi (30 mCi)	8.9	445	3.7 years
Non-cardiology imaging			
X-ray¹			
Mammogram	0.13	6	18 days
Barium enema			
(10 images, 137 second fluoroscopy)	7.0	350	2.9 years
CT head	2.0	100	9 months
CT abdomen	10	500	3 years
Nuclear medicine¹⁻³			
Bone (^{99m} Tc MDP [20 mCi])	4.4	220	1.8 years
Lung perfusion/ventilation (^{99m} Tc MAA and ¹³³ Xe [5 & 10 mCi])	1.5	75	6 months
Kidney (^{99m} Tc DTPA [20 mCi])	3.1	155	1 year
Tumour (⁶⁷ Ga [3 mCi])	12.2	610	5 years
PET CT (¹⁸ F FDG [10 mCi])	5–25	250–1,250	2.3–11.5 years

Key: CA = coronary angiography; CABG = coronary artery bypass graft; CT = computed tomography; DTPA = diethylenetriamine-pentaacetic acid; FDG = fluorodeoxyglucose; MAA = macroaggregated albumin; mCi = millicurie (radiopharmaceutical, nuclear isotope activity); MDP = methylene diphosphate; PA = posterior-anterior; PET = positron emission tomography; s/p = status post

Dual source CT flash:
< 1mSv

4208 exams (between 11/08/2008 and 14/03/2017)

- Total median effective dose (CaSc + CTA + topogram + monitoring): 14,618 mSv
- Median effective dose CaSc: 4,626 mSv
- Median effective dose CTA: 10,531 mSv

361 exams (between 21/02/2017 and 01/09/2017)

- Total median effective dose (CaSc + CTA + topogram + monitoring): 4,458 mSv
- Median effective dose CaSc: 1,009
- Median effective dose CTA: 3,156

→ Dose reduction of 69,5 %

- 221/361 patients scanned in flash mode (average HR 61 bpm, average BMI 25,8)
- 140/361 patients scanned in different scan modes

Dual source angio flash scan: total average dose (CaSc + CTA + topogram + monitoring) of 1,527 mSv (in patients with normal BMI)

Diagnosis of coronary artery disease (CAD)

Coronary anomalies

- **Anomalies of the origin**
 - Anomalous origin of coronary artery from pulmonary artery
 - Single coronary artery
 - Origin from 'non-coronary cusp'
- **Anomalies of the course**
 - Myocardial bridging
 - Duplication
- **Anomalies of termination**
 - Coronary artery fistula
 - Extracardiac termination

Malignant course = interarterial

Benign course

Myocardial bridging

Additional findings

- Cardiac CT is continuously evolving
- Today's state-of-the-art equipment will be second-best next year
- CT's main goal is to exclude coronary pathology
- Cardiac CT can only be successful when the patient benefits from the results
